Kinshi Problem Solvers 2	

Also known as Nishikigoi, the Koi is Japan's national pride. Nishikigoi literally means 'coloured carp', and is a collective name used to refer to all sorts of Koi varieties bred in Japan. A Koi is not just any fish. Its beautiful colours, patterns, often impressive size and unusual behaviour make the Koi an immensely popular fish, particularly in recent years, among pond hobbyists all over

the world.

Koikeeping: a unique hobby

However, keeping Koi is not just any hobby. It requires knowledge of a healthy biological balance and good water quality. Koi place very high demands on the water they live in. You too may place high demands on the a complete overview of products you use for your Koi. We understand that only the best products are good enough for you and your Koi. This is why we conduct extensive tests on all of our products, in our own laboratory, to ensure they satisfy the highest quality requirements.

In this brochure, you will find an overview of our products. If you still have questions after reading this brochure, simply consult our website www.kinshi.nl. Our website not only gives you all of our products, but also provides you with the opportunity to ask our specialists questions. We hope you will enjoy reading our brochure!

Bacteria

Kinshi Bacta Starter Clear gets your filter off to the right start. Kinshi Bacta Starter Clear reduces nitrite and ammonia peaks. Typical problems during the start-up phase of Koi ponds. Use Kinshi Bacta Starter Clear when filling a new pond, after administering medication or algicides, and after the winter months.

2,5 I - for 100 000 I water 0099040 5 I - for 200 000 I water 0099042 10 I - for 400 000 I water 0099044

Kinshi Bacta Clear is a waste remover for biotope ponds and ponds with a standard fish population.

1 - for 10 000 water	0099011
1 - for 20 000 water	0099010
2,5 - for 50 000 water	0099012
5 I - for 100 000 I water	0099014

Kinshi Bacta Super Clear is a super waste remover for ponds with high fish populations or Koi.

Since the fish in these ponds are usually fed a higher quantity of food, high concentrations of waste tend to develop.

2,5 I - for 100 000 I water 0099060 5 I - for 200 000 I water 0099062 10 I - for 400 000 I water 0099064

Kinshi Bacta Sludgebuster is a sludge remover for polluted ponds.

Kinshi Bacta Sludgebuster is the right solution when waste residue builds up, a layer of sludge forms on the bottom of the pond or algae bloom is lying in wait. Kinshi Bacta Sludgebuster is a powerful bacteria culture that breaks down sludge and inhibits algae bloom. Use in the autumn and winter to ensure a clean pond in the spring.

Water Treatment **Products**

(KH), total hardness

Knowledge is power!

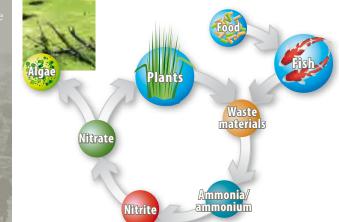

Acidity (pH)

The water's acidity is expressed in terms of its pH. A stable pH value is important to the welfare of Koi. Koi feel best when the pH is between 7.2 and 8.3.

Carbonate hardness (KH)

The carbonate hardness represents the buffering capacity of the water, and ensures that the pH value remains stable. In a Koi pond, the KH value should be between 5 and 8°KH.

Total hardness (GH)

The total hardness of the water is indicated by GH. This hardness is formed by salts from magnesium and calcium dissolved in the water. In a Koi pond, the GH value should be between 10 and 15°GH. An optimum GH value keeps the KH value stable.

Ammonia/ammonium

In a pond, fish and plants produce waste materials. Nitrogen compounds are created in the water as a result. Ammonia develops at a pH value higher than 7, ammonium at a pH value lower than 7. The higher the pH value rises, the greater the ammonia content. Even in very small amounts, ammonia is toxic to fish, whereas ammonium is less poisonous.

Nitrite and nitrate

Bacteria ensure that ammonium and ammonia are converted to nitrite. Nitrite is also toxic for Koi. Nitrite may be broken down by bacteria to form nitrate. Larger quantities of nitrate dramatically increase the chance of algae growth. Nitrate is dangerous when a lack of oxygen occurs. In this case, nitrate can release oxygen and react once again to form nitrite. Larger quantities of nitrate can therefore also result in very high quantities of the toxic nitrite!

Kinshi Aqua KH Plus raises the

KH value.

By raising the KH value, Kinshi Aqua KH Plus stabilises the pH value.

1000 g 0099092 2,5 kg 0099094

Kinshi Aqua GH Plus raises the

GH value.

By raising the GH value, Kinshi Aqua GH Plus stabilises the KH value.

Using the Kinshi Water Treatment Products, you can correct abnormal water values in the pond and improve water quality.

Kinshi Tablets consist of enzymes which break organic matter down into smaller particles, ultimately making it easier for bacteria to break these down further.

Kinshi Tablets are best administered in the filter where they will dissolve slowly and support the filter bacteria. The result is a clear pond with very little organic waste.

1 kg (+/- 260 tablets)

Kinshi Aqua Alg-02 raises the oxygen content of the water, improving the ability of micro-organisms and plants to purify the water.

Kinshi Aqua Alg-02 binds phosphates and adds minerals, causing algae to loosen from the bottom and disappear into the filter. Kinshi Aqua Alg-02 also raises the KH value of the water.

Filter Materials

Biological filter materials

Kinshi Aqua Denilit is a biological filter material with a highly porous structure and a large surface area. This provides the ideal surface for useful, waste-reducing bacteria to attach themselves, thereby contributing to the natural processing of the waste in the water. The breakdown of nitrate by denitrifying bacteria is even possible in the core of these tiny pebbles.

51 0021330 10 | 0021332 20 l 0021334

Kinshi Aqua Carbon is an adsorbent filter material with high purification properties.

Kinshi Aqua Carbon removes colourants, toxins and odours, and is very suitable for adsorbing or binding chlorine and medication. Kinshi Aqua Carbon may also be used to prevent or eliminate white or milky clouds and foam appearing in or on the surface of the water during warm periods. After several weeks or months, the filter materials will be saturated and must be replaced.

51 0021789 101 0021790

Kinshi Aqua Zeolite is an adsorbent filter material that binds the harmful waste product ammonium.

Kinshi Aqua Zeolite prevents ammonium poisoning in fish and helps fight algae growth. Kinshi Aqua Zeoliet is extremely suitable for reinforcing your pond's natural, self-cleaning ability if there is a high quantity of waste matter to be processed, for example during the spring, on hot summer days, during the autumn, or after administering medication. After several weeks or months, the filter materials will be saturated and must be replaced.

Kinshi Filter Mats consist of coarsely compressed artificial fibres for mechanical and biological water filtration. Kinshi Filter Mats are very suitable for filtering Koi ponds. The mats are very easy to clean.

Calcium and dirt can clog airstones over the course of time, preventing air from being able to flow through the stone. For this reason, you must check the stones regularly and replace them if necessary.

Food

To ensure that your fish stay healthy, you should feed them food that best suits their size and species. The quality of the food is also very important. Good nutrition ensures your Koi will have the optimum rate of growth and development, enhanced colouration, and better overall health.

The quality of the food is not only determined by the percentual composition. The types of ingredients and their quality are also crucial to good quality food. Kinshi foods contain precisely those substances that are most valuable for fish. After all, it is with good reason that our foods are referred to as high-quality foods. They are also easily digestible. This means that they are better absorbed by the fish; the fish will need less food as a result, and this leads to better water quality.

Do not feed fish a large quantity once a week, but instead feed them 1 to 2 times a day as much food as they can consume in 2 to 4 minutes. The higher the ambient temperature, the better fish are able to digest and absorb food. This is why fishes' eating habits are different during the winter than the rest of the year.

Staple foods - general

Kinshi Food Flakes is a staple food in flake form, particularly suitable for small and young fish.

Not suitable for Veil tails.

Ingredients: grains, oils, fats, fish and minerals,

Raw protein 15,0%, Raw fat 3,0%, Raw fibre 3,0%, Moisture 8,0%, Raw ash 3,5%, Vitamin A 12500 IE, Vitamin D3 500 IE, Vitamin C 200 mg, Vitamin E 80 mg

Medication and Disinfectants

Nearly all of the disease affecting Koi are caused by bacteria, fungi, protozoan (single- celled organisms) and worms. A specialist retailer can help you make the right diagnosis. Bring a sick fish and a water sample with you so that the specialist can perform a test before you start treatment.

Kinshi Combirex is a remedy used to treat infections caused by single-celled organisms such as Trichodina, Chilodonella, Ichthyobodo/ Costia.

Kinshi Potassium Permanganate

is a very powerful disinfectant.
Kinshi Potassium Permanganate is used to disinfect pond equipment and to treat the filter before the first dose of water-purifying bacteria is administered. In addition, a diluted solution of Kinshi Potassium Permanganate may be used to clean fishes' skin, ridding it of infectious parasites and disease-causing germs.
Kinshi Potassium Permanganate will also inhibit the growth of green water.

250 ml 0099140 500 ml 0099142 11 0099144 2,5 l 0099146

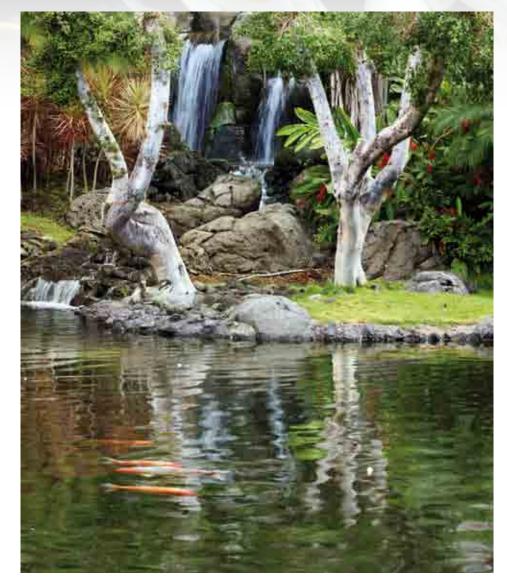

Kinshi H202 3% is a diluted solution of hydrogen peroxide which is used to reverse the effects of Kinshi Potassium Permanganate.

After administering Kinshi H2O2 3%, the purple colour will disappear from the water after a few minutes. Kinshi H2O2 3% may also be applied in oxidators and directly to the pond water if an oxygen shortage has been determined in the pond.

500 ml 0099148 1000 ml 0099149

Always follow the instructions on the packaging and administer only the exact amount indicated.

Problem Solvers

Excessive growth of algae often indicates poor water quality. This may be caused by a variety of environmental factors. Never wait too long to ask a specialist for advice. The solution is often a simple one, and responding quickly can often prevent the problem from worsening!

Kinshi Aqua Clear-Again is a

treatment used to treat cloudy pond water.

Kinshi Aqua Clear-Again causes floating dirt particles to clump so that they can be caught in the filter. **Do not** use when the pH is below 7.5 and the KH is lower than 4. It is best to place the Koi in quarantine prior to treating the water in a Koi pond. Treat the pond water with Kinshi Aqua Clear-Again, and then return the Koi to the pond as soon as the water is clear again. Depending on the water quality, treatment will take anywhere from several hours to a maximum of 24 hours.

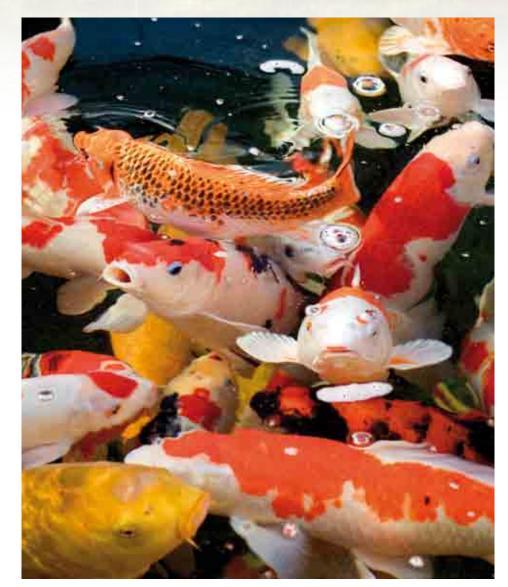

250 ml - for 5 000 l water 0099802 500 ml - for 10 000 l water 099802 1000 ml - for 20 000 l water 099804

Kinshi Aqua Eco Power is a treatment used to fight hair algae and green water. Kinshi Aqua Eco Power eliminates food for algae in the water causing it to die off. The algae is drawn into the filter where it is processed by bacteria.

2 kg - for 30 000 l water 0099110 5 kg - for 75 000 l water 0099112 10 kg - for 150 000 l water 0099111

Always follow the instructions on the packaging and give only the exact amount indicated.

Kinshi Bacta Super Clear

The super waste eliminator for ponds with a high fish population or Koi

- Promotes ponds' natural self-cleaning power
